

febi 174001

**To Fit:**

Vehicles with disc brake system, type 24/30

Scania Series 4, Series F,K,N, Series P,G,R,T

Repl. no.: 2 147 775

EN

Consistent Quality. Full Stop! febi Double Diaphragm Cylinder

Almost all commercial vehicles over 7.5 t gross weight are equipped with a pneumatic brake system. Double diaphragm cylinders, also called combi- or tristop cylinders, are usually installed as brake cylinders on the rear axle of the towing vehicle and also in trailers. They combine the function of the service brake and the parking brake. In addition, they have an emergency brake function which automatically applies the brake by spring force if the compressed air supply fails.

Diaphragm brake cylinders can be found on both disc and drum brakes. Because of their important role in actuating the brake, the brake cylinders must be checked regularly. If they do not function properly, or if they are corroded or leak, they must be replaced.

New in the range is the febi 174001 double diaphragm cylinder for disc brakes type 24/30 suitable for many Scania vehicles. With its wide range of brake cylinders, febi covers the common vehicle types of the major European commercial vehicle manufacturers.
